11. Deploying a Zoho Creator Application from Development to Production Environment

Aim

To deploy the Gym Membership Enrollment application developed in Zoho Creator from the Development environment, through the Stage environment, to the Production environment, and to verify the deployment.

Procedure

1. Sign in to Zoho Creator and open the Applications dashboard. The Gym Membership Enrollment application is available in the Development environment with Edit, Access and Settings options.

2. Under DEPLOY, open Environments and add the gym membership enrollment application to the multi-stage deployment space. Confirm the message that the application was added and the development environment is being created.

3. Check the Development, Stage and Production columns. The Stage column shows "Stage app not yet created" until the application is published to Stage.

4. Open the application's Settings and use the Environment Settings drop-down to select Development, Stage or Production.

5. In the Stage environment settings, review the Demo Users, Notifications, AI Models, Variables and Workflow Schedules tabs and add a demo user (demouser_1 with Write permission and CEO role) for testing.

6. Publish the application from Development to Stage and test the Membership_Enrollment_Form, Membership_PaymentDetails form, reports and dashboard using the demo user.

7. Open Version History and verify the published package and its version (Default Package 1.0, Version Type Major).

8. After testing, publish the tested version from Stage to Production and use the Environment menu on the application card (Open in Environment) to confirm the application opens in Production.

9. For migration, create a New Backup from Operations (Frequency: Monthly, Components: Schema + Data) and use Duplicate Application to create a copy of the application.

Result

The Gym Membership Enrollment application was deployed from the Development environment to the Stage environment for testing and then to the Production environment. The deployment was verified using Environment Settings and Version History, and the application was migrated using Backup and Duplicate Application. The screenshots below can be used as evidence of the deployment performed.

Roll No: 241501244
