10. Performance Optimization in Zoho Creator

Aim

To improve the performance and efficiency of the Gym Membership Enrollment application developed using Zoho Creator.

Procedure

1. Review the existing **Membership Enrollment** form, reports and pages to identify unnecessary fields and components.
2. Separate the basic and advanced fields across the **Membership_Enrollment_Form** (member details, plan and workout details) and the **Membership_PaymentDetails** form (plan fee, discount, payment status, membership status, plan duration and last renewal date), and remove the fields that are not needed.
3. Optimize the member record search process by using appropriate search and filter options for **Member Name**, **Email Address** and **Membership Type**.
4. Review the available **Deluge** workflows to identify and remove redundant operations wherever possible.
5. Check the reports to ensure that only the required details are displayed, making it easier to access member information, payment details and membership status.
6. Verify the data import options (Local storage, URL, Cloud service and Paste Data) and the supported file formats and size limit on the report's **Import Data** screen.
7. Test the application using multiple member records to observe its loading, searching and record-processing behaviour.

Result

The Gym Membership Enrollment application was reviewed and optimized to improve usability and record retrieval. The search and filtering process helps users locate member records more efficiently, while reviewing workflows helps avoid unnecessary processing. Before-and-after screenshots of the search process and report layout can be used as evidence of the optimization performed. Actual response-time improvements should be reported only if measured during testing.
