Experiment 14 — Pro-Code Extension using Zoho Catalyst (Gym Membership Application)

Aim

To extend the low-code Gym Membership Enrollment & Front Desk Management application built in Zoho Creator with pro-code capabilities using Zoho Catalyst, and to explore its serverless, hosting and DevOps features.

Procedure

1. Open catalyst.zoho.com and click Access Catalyst to sign in with the Zoho account.
2. Create a new Catalyst project (for example, Project-Gym) and open the Development environment.
3. Open Slate to view the front-end hosting service, and review the AI Agent announcement and the toolkit options for Claude Code, Cursor, Codex and VS Code.
4. Open Serverless and plan a function for the gym application, such as calculating the membership fee with a renewal or corporate discount, which Zoho Creator can call through an API.
5. Open DevOps and review Application Alerts, APM and Logs for monitoring the deployed functions.
6. Open Pipelines, click Create New Pipeline, enter a pipeline name and select an integration source (GitHub, GitLab or Bitbucket) to automate build and deployment.
7. Note how the Catalyst function and the Creator application work together as a hybrid solution.

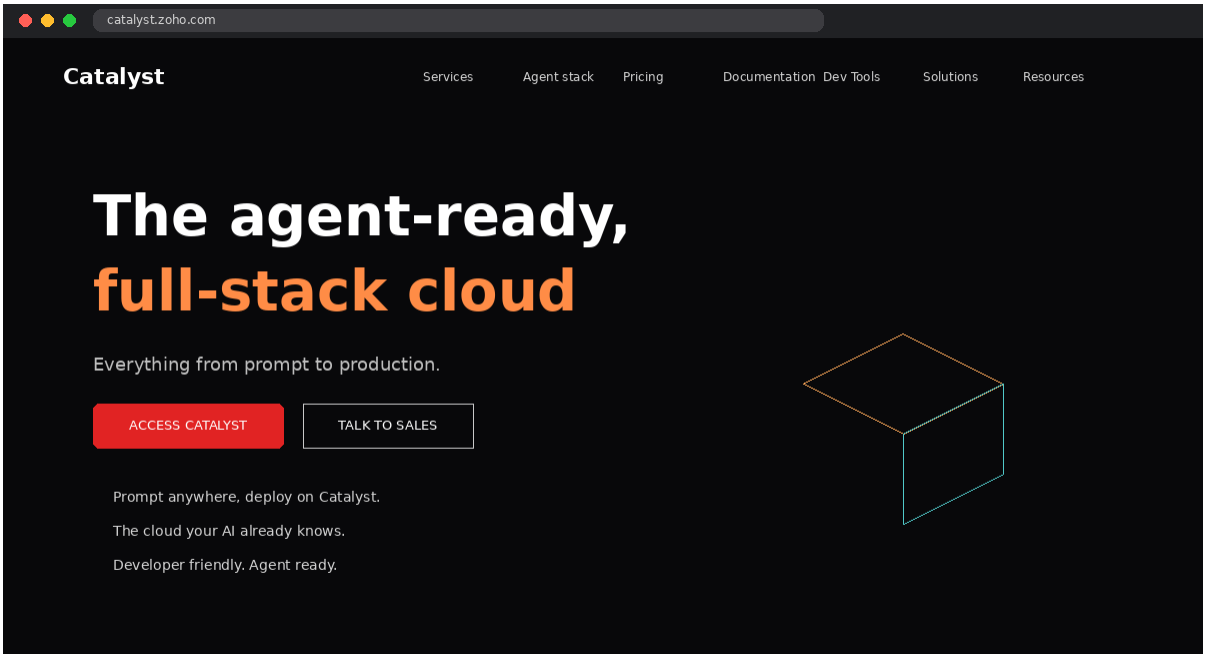

Introduction

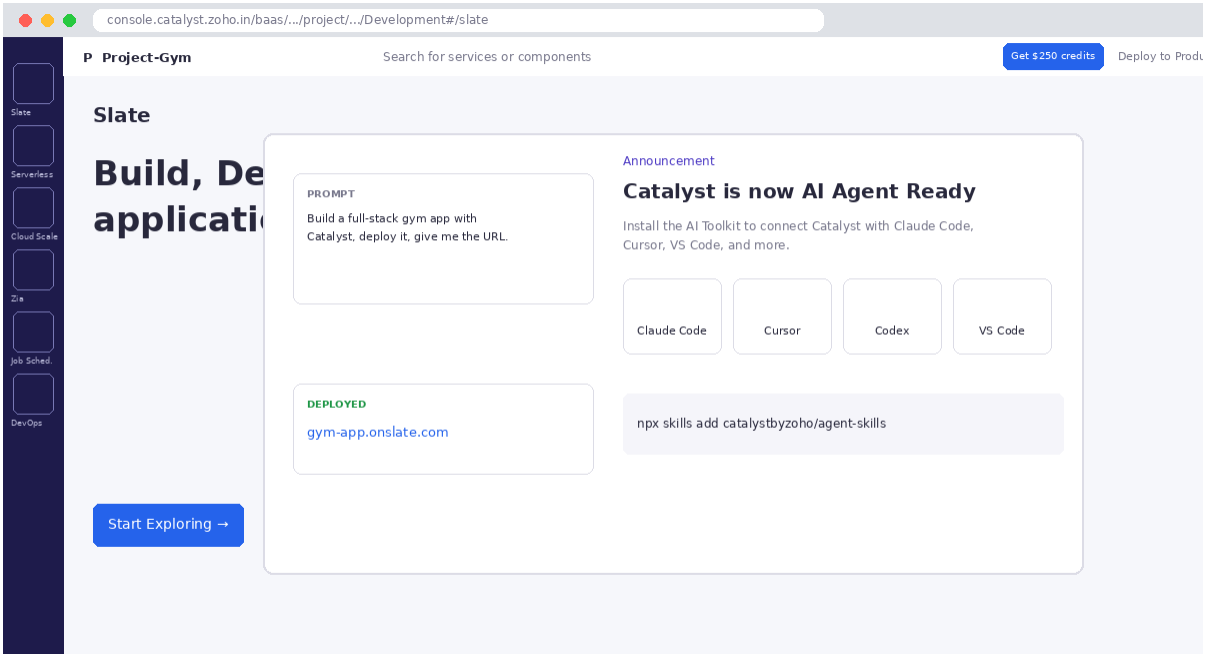

Low-code platforms handle standard forms, reports and workflows, but specialized logic and integrations need traditional code. Zoho Catalyst is a full-stack cloud platform from Zoho that offers serverless functions, front-end hosting, storage, DevOps tools and CI/CD pipelines. It lets developers add pro-code extensions to Zoho Creator applications.

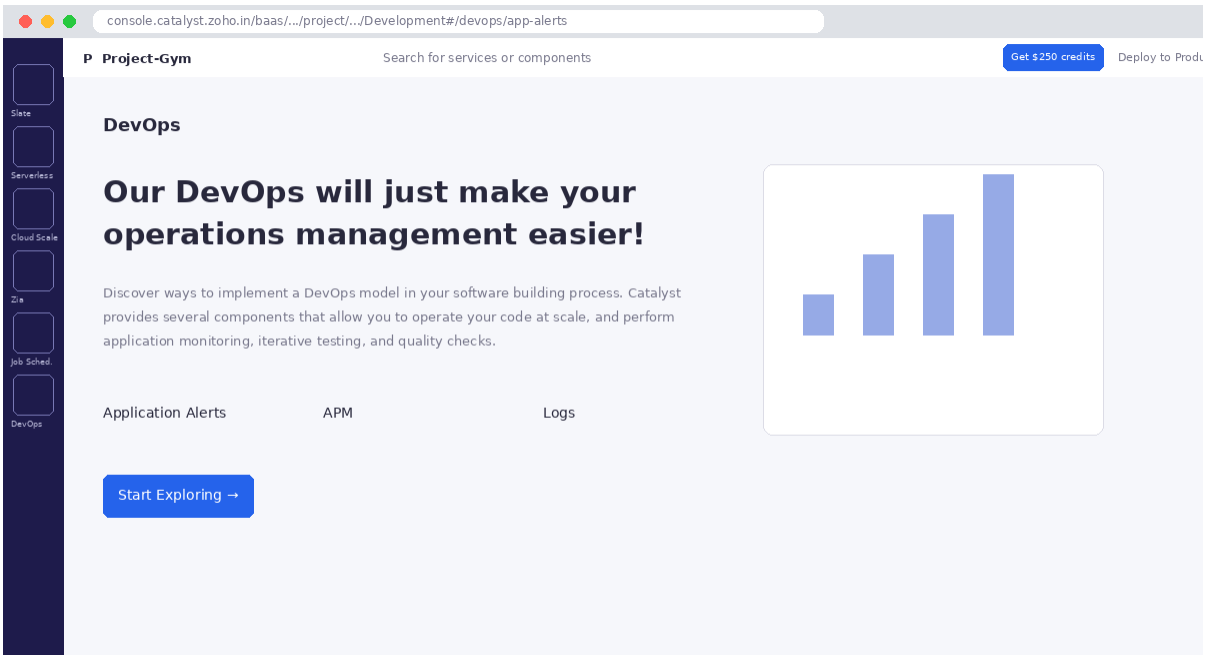

Use of Catalyst in the Gym Application

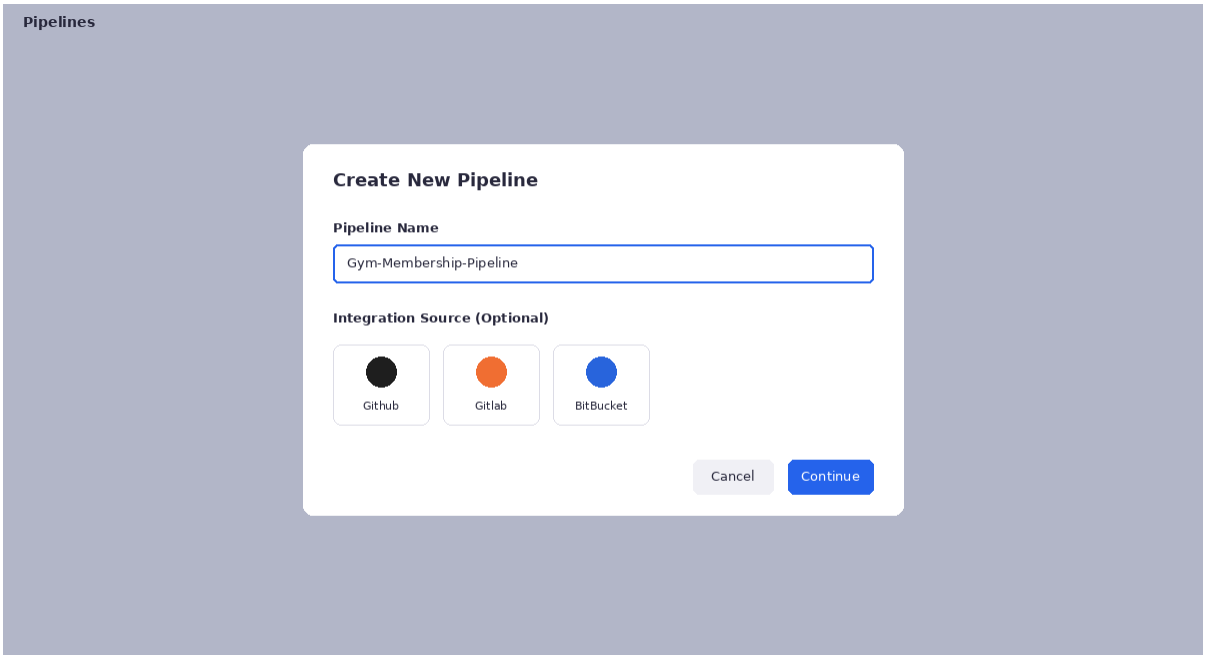

- Fee calculation: a serverless function computes the final fee using plan, membership type and discount rules.
- External integration: a custom API connects the application to a payment gateway or door-access system.
- Custom front end: a member portal can be hosted on Slate and linked to the Creator data.
- Monitoring: DevOps tools track errors, performance and logs of the deployed code.
- Automation: Pipelines deploy code automatically from a Git repository.

Screenshots

Result

Zoho Catalyst was explored as a pro-code extension for the Gym Membership Enrollment & Front Desk Management application. It adds serverless logic, hosting, monitoring and CI/CD pipelines, showing how low-code and pro-code can be combined to meet advanced requirements.
